A Declarative Semantics for SNOMED CT Expression Constraints

April 30, 2015

Contents

1 Data Types

1.1 Atomic Data Types

This section identifies the atomic data types that are assumed for the rest of this specification. These types are defined as lexical components in the specification.

```
sctId = digitNonZero 5*17( digit )
term = 1*nonwsNonPipe *( 1*SP 1*nonwsNonPipe )
numericValue = QM stringValue QM / ”#” numericValue ( decimalValue / integerValue)
stringValue = QM 1*(anyNonEscapedChar / escapedChar) QM
integerValue = ( [”-”/”+”] digitNonZero *digit ) / zero
decimalValue = integerValue ”.” 1*digit
nonNegativeIntegerValue = (digitNonZero *digit ) / zero
```

- SCTID – *A SNOMED CT id is used to represent an attribute id or a concept id. The initial digit may not be zero. The smallest number of digits is six, and the maximum is 18.*
- TERM – *The term must be the term from a SNOMED CT description that is associated with the concept identified by the preceding concept identifier. For example, the term could be the preferred description, or the preferred description associated with a particular translation. The term may include valid UTF-8 characters except for the pipe ”|” character. The term begins with the first non-whitespace character following the starting ”|” character and ends with the last non-whitespace character preceding the next ”|” character.*
- STRINGVALUE – *A string value includes one or more of any printable ASCII characters enclosed in quotation marks. Quotes and backslash characters within the string must be preceded by the escape character (”\”).*
- $\mathbb{Z}$ – built-in Z equivalent of INTEGERVALUE . *An integer may be positive, negative or zero. Positive integers optionally start with a plus sign (”+”), followed by a non-zero digit followed by zero to many additional digits. Negative integers begin with a minus sign (”-”) followed by a non-zero digit and zero to many additional digits.*
- DECIMALVALUE – *A decimal value starts with an integer. This is followed by a decimal point and one to many digits.*
- $\mathbb{N}$ – built-in Z equivalent of NONNEGATIVEINTEGERVALUE
- GROUPID – a role group identifier. (Not explicated in the specification, but needed)

$$[sctId, term, decimalValue, stringValue, groupId]$$

We specifically define some well known identifiers: the *is_a* attribute, the *zero_group* and *attribute_concept*, and *refset_concept* the parents of all attributes and all refsets respectively.

$is\_a : sctId$
$zero\_group : groupId$
$attribute\_concept : sctId$
$refset\_concept : sctId$

1.2 Composite Data Types

concreteValue is in anticipation of the enhanced specification that includes target strings, integers or decimals.

- **concreteValue** – a string, integer or decimal literal
- **target** – the target of a relationship that is either an *sctId* or a *concreteValue*

$$concreteValue ::= cv\_string \langle\langle stringValue \rangle\rangle \mid cv\_integer \langle\langle \mathbb{Z} \rangle\rangle \mid cv\_decimal \langle\langle decimalValue \rangle\rangle$$

$$target ::= t\_sctid \langle\langle sctId \rangle\rangle \mid t\_concrete \langle\langle concreteValue \rangle\rangle$$

2 The Substrate

A substrate represents the context of an interpretation.

2.1 Substrate Components

2.1.1 Quad

Relationships in the substrate are represented a 4 element tuples or "quads" which consist of a source, attribute, target and role group identifier. The is_a attribute may only appear in the zero group, and the target of an is_a attribute must be a $sctId$ (not a $concreteValue$)

Quad

$s : sctId$
$a : sctId$
$t : target$
$g : groupId$

$a = is\_a \Rightarrow (g = zero\_group \wedge t \in \operatorname{ran} t\_sctid)$

2.1.2 conceptReference

The root of the expression constraint language is concept references:

- CONCEPTREFERENCE – *A conceptReference is represented by a ConceptId optionally followed by a term enclosed by a pair of "|" characters. Whitespace before or after the ConceptId is ignored as is any whitespace between the initial "|" characters and the first non-whitespace character in the term or between the last non-whitespace character and before second "|" character.* TERM is ignored for the purposes of interpretation.

- CONCEPTID – *The ConceptId must be a valid SNOMED CT identifier for a concept. The initial digit may not be zero. The smallest number of digits is six, and the maximum is 18.*

- ATTRIBUTENAME – *The attribute name is the name of an attribute (or relationship type) to which a value is applied to refine the meaning of a containing expression. The attribute name is represented in the same way as other concept references. If the attribute name is not known then a wild card may be used to represent any attribute concept in the given substrate.*

```
conceptReference = conceptId [ws "|" ws term ws "|"]
conceptId = sctId
attributeName = conceptReference / wildCard
```

$$\begin{aligned}&\mathit{conceptReference} == \mathit{conceptId} \times \mathit{term}[0\mathinner{\ldotp\ldotp}1]\\&\mathit{conceptId} == \mathit{sctId}\\&\mathit{attributeName} ::= \mathit{ancr}\langle\langle \mathit{conceptReference}\rangle\rangle \mid \mathit{anwc}\end{aligned}$$

2.2 Substrate

2.2.1 Substrate Definition

A substrate consists of:

- **concepts** The set of *sctIds* (concepts) that are considered valid in the context of the substrate.
- **relationships** A set of relationship quads (source, attribute, target, group)
- **parentsOf** A function from an sctId to its asserted and inferred parents
- **equivalent_concepts** A function from an sctId to the set of sctId's that have been determined to be equivalent to it.
- **refsets** The reference sets within the context of the substrate whose members are members are concept identifiers (i.e. are in *concepts*). While not formally spelled out in this specification, it is assumed that the typical reference set function would be returning a subset of the *refsetId* / *referencedComponentId* tuples represented in one or more RF2 Refset Distribution tables.

The following functions can be computed from the basic set above

- **childrenOf** The inverse of the parentsOf function
- **descendants** The transitive closure of the childrenOf function
- **ancestors** The transitive closure of the parentsOf function

A substrate also implements three functions:

- **i_conceptReference** The interpretation of a concept reference. This function can return a (possibly empty) set of sctId's or an error.
- **i_attributeName** The interpretation of an attribute name. This function can return a (possibly empty) set of sctId's or an error.
- **i_refsetId** The interpretation of a refset identifier. This function can return a (possibly empty) set of sctId's or an error.

The formal definition of substrate follows. The expressions below assert that:

1. All *relationship* sources, attributes and sctId targets are in *concepts*.
2. There is a *parentsOf* entry for every substrate *concept*.
3. Every sctId that can be returned by the *parentsOf* function is a *concept*.
4. Every *is_a* relationship entry is represented in the *parentsOf* function. Note that there can be additional entries represented in the *parentsOf* function that aren't in the relationships table.
5. There is an *equivalent_concepts* assertion for every substrate *concept*.
6. The *equivalent_concepts* function is reflexive (i.e. every concept is equivalent to itself).
7. All equivalent concepts are in *concepts*.

8. If two concepts (c2 and c2) are equivalent, then they:
   - Have the same parents
   - Appear the subject, attribute and object of the same set of relationships
   - Appear in the domain of the same set of refsets
   - Both appear in the range of any refset that one appears in
9. Every refset is a substrate *concept*
10. Every member of a refset is a substrate *concept*
11. *childrenOf* is the inverse of *parentsOf*, where any concept that doesn't appear a parent has no (the emptyset) children.
12. *descendants* is the transitive closure of the *childrenOf* function
13. *ancestors* is the transitive closure of the *parentsOf* function
14. No concept can be its own ancestor (or, by inference, descendant)
15. The *i_conceptReference*, *i_attributeName* and *i_refsetId* functions are defined for all possible *conceptReferences* and *attributeNames* (because they are complete functions).
16. All $sctId's$ that are produced by the The *i_conceptReference*, *i_attributeName* and *i_refsetId* functions are substrate *concepts*.

Substrate

$$
\begin{array}{l}

\qquad\qquad c1 \in \operatorname{dom} refsets \Leftrightarrow c2 \in \operatorname{dom} refsets \land \\
\qquad\qquad c1 \in \operatorname{dom} refsets \Rightarrow refsets\ c1 = refsets\ c2 \land \\
\qquad\qquad (\forall\, rsd : \operatorname{ran} refsets \bullet c1 \in rsd \Leftrightarrow c2 \in rsd) \\[1ex]
\operatorname{dom} refsets \subseteq concepts \\
\bigcup(\operatorname{ran} refsets) \subseteq concepts \\[1ex]
\operatorname{dom} childrenOf = concepts \\
\forall\, s, t : concepts \bullet t \in parentsOf\ s \Leftrightarrow s \in childrenOf\ t \\
\forall\, c : concepts \mid c \notin \bigcup(\operatorname{ran} childrenOf) \bullet childrenOf\ c = \emptyset \\
\forall\, s : concepts \bullet \\
\qquad\qquad descendants\ s = childrenOf\ s \cup \bigcup\{t : childrenOf\ s \bullet descendants\ t\} \\
\forall\, t : concepts \bullet \\
\qquad\qquad ancestors\ t = parentsOf\ t \cup \bigcup\{s : parentsOf\ t \bullet ancestors\ s\} \\
\forall\, t : concepts \bullet t \notin ancestors\ t \\[1ex]
groups = \{r : relationships \bullet r.g\} \\
subjects = \{r : relationships \bullet r.s\} \\
targets = \{r : relationships \bullet r.t\} \\[1ex]
\forall\, cr\_interp : \operatorname{ran} i\_conceptReference \mid cr\_interp \in \operatorname{ran} ok \bullet \\
\qquad\qquad result\_sctids\ cr\_interp \subseteq concepts \\
\forall\, att\_interp : \operatorname{ran} i\_attributeName \mid att\_interp \in \operatorname{ran} ok \bullet \\
\qquad\qquad result\_sctids\ att\_interp \subseteq concepts \\
\forall\, refset\_interp : \operatorname{ran} i\_refsetId \mid refset\_interp \in \operatorname{ran} ok \bullet \\
\qquad\qquad result\_sctids\ refset\_interp \subseteq concepts
\end{array}
$$

Implementations may choose to implement "strict" substrates, where additional rules apply or "permissive" substrates where rules are relaxed.

2.2.2 Strict Substrate

A **strict_substrate** is a substrate where:

- If a conceptReference is not in the substrate concepts it returns an error, otherwise the set of equivalent concepts
- If an attribute name is a conceptReference and it is not in the substrate concepts or is not a descendant of the attribute_concept it returns an error, otherwise the set of equivalent attributes. If an attribute name is a wild card, it returns all descendants of attribute_concept
- If a concept reference that is a target of a memberOf function is not in the substrate concepts or is not a descendant of the refset_concept it returns an error, otherwise the set of equivalent refset identifiers

$$
\begin{array}{l}
\textit{strict\_substrate} \\
\hline
\textit{Substrate} \\
\hline
\forall\, cr : conceptReference \bullet i\_conceptReference\ cr = \\
\quad \textbf{if}\ \mathit{first}\ cr \notin concepts\ \textbf{then}\ error\ unknownConceptReference \\
\quad \textbf{else}\ ok\ (equivalent\_concepts\ (\mathit{first}\ cr)) \\
\\
\forall\, an : attributeName \bullet i\_attributeName\ an = \\
\textbf{if}\ ancr^{\sim} an \in conceptReference\ \textbf{then} \\
\quad (\textbf{let}\ rslt == i\_conceptReference\ (ancr^{\sim} an) \bullet \\
\qquad \textbf{if}\ rslt \in \operatorname{ran} error\ \textbf{then}\ rslt \\
\qquad \textbf{else if}\ result\_sctids\ rslt \subseteq (descendants\ attribute\_concept) \\
\qquad\quad \textbf{then}\ rslt \\
\qquad \textbf{else} \\
\qquad\quad error\ unknownAttributeId) \\
\textbf{else} \\
\quad ok\ (descendants\ attribute\_concept) \\
\\
\forall\, rsid : sctId \bullet i\_refsetId\ rsid = \\
\quad \textbf{if}\ rsid \in descendants\ refset\_concept \\
\qquad \textbf{then}\ ok\ \{rsid\} \\
\quad \textbf{else}\ error\ unknownRefsetId \\
\hline
\end{array}
$$

2.2.3 Permissive Substrate

A **permissive_substrate** never raises an error condition. concept references that are not in the substrate are "discarded" (i.e. map to the empty set). Any valid conceptReference may be used in the position of an attribute or a refset id. The attributeName wild card returns the set of all possible concepts.

$$
\begin{array}{l}
\textit{permissive\_substrate} \\
\hline
\textit{Substrate} \\
\hline
\forall\, cr : conceptReference \bullet i\_conceptReference\ cr = \\
\qquad \textbf{if}\ \textit{first}\ cr \notin concepts\ \textbf{then}\ ok\,\emptyset \\
\qquad \textbf{else}\ ok\,(equivalent\_concepts\,(\textit{first}\ cr)) \\
\\
\forall\, an : attributeName \bullet i\_attributeName\ an = \\
\textbf{if}\ ancr^{\sim}\,an \in conceptReference\ \textbf{then} \\
\qquad i\_conceptReference\,(ancr^{\sim}\,an) \\
\textbf{else} \\
\qquad ok\ concepts \\
\\
\forall\, rsid : sctId \bullet i\_refsetId\ rsid = \\
\qquad \textbf{if}\ rsid \notin concepts\ \textbf{then}\ ok\,\emptyset \\
\qquad \textbf{else}\ ok\,(equivalent\_concepts\,(rsid)) \\
\hline
\end{array}
$$

3 Interpretation of Expression Constraints

An EXPRESSIONCONSTRAINT is interpreted in the context of a *Substrate* and returns a set of *sctId*s or an error indicator.

3.1 Interpretation Output

The result of applying a query against a substrate is either a (possibly empty) set of sctId's or an *ERROR*. An *ERROR* occurs when:

- The interpretation of a conceptId is not a substrate *concept*
- The interpretation of a relationship attribute is not a substrate *attributeId*
- The interpretation of a reset is not a substrate *refsetId*

$$ERROR ::= unknownConceptReference \mid unknownAttributeId \mid unknownRefsetId$$

$$Sctids\_or\_Error ::= ok\langle\langle \mathbb{P}\, sctId \rangle\rangle \mid error\langle\langle ERROR \rangle\rangle$$

Each interpretation that follows begins with a simplified version of the language construct in the specification. It then formally specifies the constructs that are used in the interpretation, followed by the interpretation itself. We start with the definition of *expressionConstraint*, which, once interpreted, returns either a set of sctIds or an error condition.

3.2 expressionConstraint

An expression constraint is either a refined expression constraint or an unrefined expression constraint.

```
expressionConstraint = ws ( refinedExpressionConstraint / unrefinedExpressionConstraint )
ws
```

The interpretation of an EXPRESSIONCONSTRAINT is the interpretation of either the REFINEDEXPRESSIONCONSTRAINT or the UNREFINEDEXPRESSIONCONSTRAINT .

$$\begin{aligned} &expressionConstraint ::= \\ &\qquad expcons\_refined\langle\langle refinedExpressionConstraint \rangle\rangle \mid \\ &\qquad expcons\_unrefined\langle\langle unrefinedExpressionConstraint \rangle\rangle \end{aligned}$$

$$
\begin{array}{l}
i\_expressionConstraint : \\
\quad Substrate \rightarrow expressionConstraint \rightarrow Sctids\_or\_Error \\
\hline
\forall ss : Substrate;\ ec : expressionConstraint \bullet i\_expressionConstraint\ ss\ ec = \\
\textbf{if}\ ec \in \operatorname{ran} expcons\_refined \\
\textbf{then} \\
\quad i\_refinedExpressionConstraint\ ss\ (expcons\_refined^{\sim}\ ec) \\
\textbf{else} \\
\quad i\_unrefinedExpressionConstraint\ ss\ (expcons\_unrefined^{\sim}\ ec)
\end{array}
$$

3.2.1 unrefinedExpressionConstraint

An unrefined expression constraint is either compound or simple.

unrefinedExpressionConstraint = compoundExpressionConstraint / simpleExpressionConstraint

The interpretation of an UNREFINEDEXPRESSIONCONSTRAINT is either the interpretation of a COMPOUNDEXPRESSIONCONSTRAINT or a SIMPLEEXPRESSIONCONSTRAINT

$$
\begin{array}{l}
unrefinedExpressionConstraint ::= \\
\quad unrefined\_compound\langle\langle compoundExpressionConstraint\rangle\rangle \mid \\
\quad unrefined\_simple\langle\langle simpleExpressionConstraint\rangle\rangle
\end{array}
$$

$$
\begin{array}{l}
i\_unrefinedExpressionConstraint : \\
\quad Substrate \rightarrow unrefinedExpressionConstraint \rightarrow Sctids\_or\_Error \\
\hline
\forall ss : Substrate;\ uec : unrefinedExpressionConstraint \bullet \\
i\_unrefinedExpressionConstraint\ ss\ uec = \\
\textbf{if}\ uec \in \operatorname{ran} unrefined\_compound \\
\textbf{then} \\
\quad i\_compoundExpressionConstraint\ ss\ (unrefined\_compound^{\sim}\ uec) \\
\textbf{else} \\
\quad i\_simpleExpressionConstraint\ ss\ (unrefined\_simple^{\sim}\ uec)
\end{array}
$$

3.2.2 refinedExpressionConstraint

A refined expression constraint starts with an unrefined expression constraint and adds a refinement. Refined expression constraints may optionally be placed in brackets.

refinedExpressionConstraint = unrefinedExpressionConstraint ws ":" ws refinement / "(" ws refinedExpressionConstraint ws ")"

The interpretation of REFINEDEXPRESSIONCONSTRAINT is the intersection of the interpretation of the UNREFINEDEXPRESSIONCONSTRAINT and the REFINEMENT , both of which return a set of sctId's or an error. The second production defines REFINEDEXPRESSIONCONSTRAINT in terms of itself and has no effect on the results.

Note: The second declaration below ($refinedExpressionConstraint'$) is used to avoid circular definitions.

$$
\begin{aligned}
&refinedExpressionConstraint == \\
&\qquad unrefinedExpressionConstraint \times refinement \\
&[refinedExpressionConstraint']
\end{aligned}
$$

$$
\begin{aligned}
&i\_refinedExpressionConstraint : \\
&\quad Substrate \to refinedExpressionConstraint \to Sctids\_or\_Error \\
\hline
&\forall\, ss : Substrate;\ rec : refinedExpressionConstraint \bullet \\
&(\mathbf{let}\ unref\_interp == (i\_unrefinedExpressionConstraint\ ss\ (first\ rec)) \bullet \\
&\quad i\_refinedExpressionConstraint\ ss\ rec = \\
&\qquad intersect\ unref\_interp(i\_refinement\ ss\ (second\ rec)))
\end{aligned}
$$

Duplicate signature for recursive definitions

$$
\begin{aligned}
&i\_refinedExpressionConstraint' : \\
&\quad Substrate \to refinedExpressionConstraint' \to Sctids\_or\_Error
\end{aligned}
$$

3.2.3 simpleExpressionConstraint

A simple expression constraint includes exactly one focus concept, optionally preceded by a constraint operator.

simpleExpressionConstraint = [constraintOperator ws] focusConcept

The interpretation of SIMPLEEXPRESSIONCONSTRAINT is the application of an optional constraint operator to the interpretation of FOCUSCONCEPT , which returns a set of sctId's or an error. The interpretation of an error is the error.

$$simpleExpressionConstraint == constraintOperator[0\,..\,1] \times focusConcept$$

$$i\_simpleExpressionConstraint : \\ \quad Substrate \rightarrow simpleExpressionConstraint \rightarrow Sctids\_or\_Error$$

$$\forall ss : Substrate;\ sec : simpleExpressionConstraint \bullet \\ i\_simpleExpressionConstraint\ ss\ sec = \\ \quad i\_constraintOperator\ ss\ (first\ sec)\ (i\_focusConcept\ ss\ (second\ sec))$$

3.2.4 compoundExpressionConstraint

A compound expression constraint contains two or more simple expression constraints joined by either a conjunction, disjunction or exclusion. Compound expression constraints may optionally be placed in brackets.

compoundExpressionConstraint = conjunctionExpressionConstraint / disjunctionExpression-Constraint / exclusionExpressionConstraint / "(" ws compoundExpressionConstraint ws ")"

The interpretation of a *compoundExpressionConstraint* is the interpretation the conjunction, disjunction or exclusion of nested compound constraint.

$$compoundExpressionConstraint ::= \\ \quad compound\_conj \langle\langle conjunctionExpressionConstraint \rangle\rangle \mid \\ \quad compound\_disj \langle\langle disjunctionExpressionConstraint \rangle\rangle \mid \\ \quad compound\_excl \langle\langle exclusionExpressionConstraint \rangle\rangle \mid \\ \quad compound\_nested \langle\langle compoundExpressionConstraint' \rangle\rangle \\ [compoundExpressionConstraint']$$

$$i\_compoundExpressionConstraint : \\ \quad Substrate \rightarrow compoundExpressionConstraint \rightarrow Sctids\_or\_Error$$

$$\forall ss : Substrate;\ cec : compoundExpressionConstraint \bullet \\ i\_compoundExpressionConstraint\ ss\ cec = \\ \textbf{if}\ cec \in \mathrm{ran}\ compound\_conj\ \textbf{then} \\ \quad i\_conjunctionExpressionConstraint\ ss\ (compound\_conj^{\sim}\ cec) \\ \textbf{else if}\ cec \in \mathrm{ran}\ compound\_disj\ \textbf{then} \\ \quad i\_disjunctionExpressionConstraint\ ss\ (compound\_disj^{\sim}\ cec) \\ \textbf{else if}\ cec \in \mathrm{ran}\ compound\_excl\ \textbf{then} \\ \quad i\_exclusionExpressionConstraint\ ss\ (compound\_excl^{\sim}\ cec) \\ \textbf{else} \\ \quad i\_compoundExpressionConstraint'\ ss\ (compound\_nested^{\sim}\ cec)$$

$$i\_compoundExpressionConstraint' : \\ \quad Substrate \rightarrow compoundExpressionConstraint' \rightarrow Sctids\_or\_Error$$

3.2.5 conjunctionExpressionConstraint

A conjunction expression constraint combines two or more expression constraints with a conjunction ("and") operator. More than one conjunction may be used without brackets. However any compound expression constraint (using a different binary operator) that appears within a conjunction expression constraint must be enclosed by brackets.

conjunctionExpressionConstraint = subExpressionConstraint 1*(ws conjunction ws subExpressionConstraint)

CONJUNCTIONEXPRESSIONCONSTRAINT is interpreted as the intersection of the interpretations of the SUBEXPRESSIONCONSTRAINTS .

$$conjunctionExpressionConstraint == \\ subExpressionConstraint \times \mathrm{seq}_1(subExpressionConstraint)$$

Apply the intersection operator to the interpretation of each subExpressionConstraint

$$i\_conjunctionExpressionConstraint : \\ Substrate \to conjunctionExpressionConstraint \to Sctids\_or\_Error$$

$$\forall\, ss : Substrate;\ cecr : conjunctionExpressionConstraint \bullet \\ i\_conjunctionExpressionConstraint\ ss\ cecr = \\ applyToSequence\ ss\ i\_subExpressionConstraint\ intersect\ cecr$$

3.2.6 disjunctionExpressionConstraint

A disjunction expression constraint combines two or more expression constraints with a disjunction ("or") operator. More than one disjunction may be used without brackets. However any compound expression constraint (using a different binary operator) that appears within a disjunction expression constraint must be enclosed by brackets.

disjunctionExpressionConstraint = subExpressionConstraint 1*(ws disjunction ws subExpressionConstraint)

$$disjunctionExpressionConstraint == \\ subExpressionConstraint \times \mathrm{seq}_1(subExpressionConstraint)$$

DISJUNCTIONEXPRESSIONCONSTRAINT is interpreted as the union of the interpretations of the SUBEXPRESSIONCONSTRAINTS .

$$
\begin{array}{l}
i\_disjunctionExpressionConstraint : \\
\quad Substrate \rightarrow disjunctionExpressionConstraint \rightarrow Sctids\_or\_Error \\
\hline
\forall ss : Substrate;\ decr : disjunctionExpressionConstraint \bullet \\
i\_disjunctionExpressionConstraint\ ss\ decr = \\
\quad applyToSequence\ ss\ i\_subExpressionConstraint\ union\ decr
\end{array}
$$

3.2.7 exclusionExpressionConstraint

An exclusion expression constraint combines two expression constrains with an exclusion (”minus”) operator. A single exclusion operator may be used without brackets. However when the operands of the exclusion expression constraint are compound, these compound expression constraints must be enclosed by brackets.

exclusionExpressionConstraint = subExpressionConstraint ws exclusion ws subExpressionConstraint

EXCLUSIONESPRESSIONCONSTRAINT is interpreted as the interpretation of the SUBEXPRESSIONCONSTRAINT minus the interpretation of the second.

$$
\begin{array}{l}
exclusionExpressionConstraint == \\
\qquad subExpressionConstraint \times subExpressionConstraint
\end{array}
$$

$$
\begin{array}{l}
i\_exclusionExpressionConstraint : \\
\qquad Substrate \rightarrow exclusionExpressionConstraint \rightarrow Sctids\_or\_Error \\
\hline
\forall ss : Substrate;\ ecr : exclusionExpressionConstraint \bullet \\
(\mathbf{let}\ first\_sec == (i\_subExpressionConstraint\ ss\ (first\ ecr)); \\
\quad second\_sec == (i\_subExpressionConstraint\ ss\ (second\ ecr)) \bullet \\
i\_exclusionExpressionConstraint\ ss\ ecr = minus\ first\_sec\ second\_sec)
\end{array}
$$

3.2.8 subExpressionConstraint

A subexpression constraint, which appears within a compound expression constraint, must either be simple, or a bracketed compound or refined expression constraint.

subExpressionConstraint = simpleExpressionConstraint / "(" ws (compoundExpressionConstraint / refinedExpressionConstraint) ws ")"

The interpretation of SUBEXPRESSIONCONSTRAINT is the interpretation the SIMPLEEXPRESSIONCONSTRAINT COMPOUNDEXPRESSIONCONSTRAINT or REFINEDEXPRESSIONCONSTRAINT

$$\begin{array}{l} \mathit{subExpressionConstraint} ::= \\ \quad \mathit{subExpr\_simple}\langle\langle \mathit{simpleExpressionConstraint} \rangle\rangle \mid \\ \quad \mathit{subExpr\_compound}\langle\langle \mathit{compoundExpressionConstraint}' \rangle\rangle \mid \\ \quad \mathit{subExpr\_refined}\langle\langle \mathit{refinedExpressionConstraint}' \rangle\rangle \end{array}$$

$$\begin{array}{l} \mathit{i\_subExpressionConstraint} : \\ \qquad \mathit{Substrate} \rightarrow \mathit{subExpressionConstraint} \rightarrow \mathit{Sctids\_or\_Error} \\ \hline \forall\, \mathit{ss} : \mathit{Substrate};\ \mathit{sec} : \mathit{subExpressionConstraint} \bullet \\ \mathit{i\_subExpressionConstraint}\ \mathit{ss}\ \mathit{sec} = \\ \mathbf{if}\ \mathit{sec} \in \operatorname{ran} \mathit{subExpr\_simple}\ \mathbf{then} \\ \quad \mathit{i\_simpleExpressionConstraint}\ \mathit{ss}\ (\mathit{subExpr\_simple}^{\sim}\ \mathit{sec}) \\ \mathbf{else\ if}\ \mathit{sec} \in \operatorname{ran} \mathit{subExpr\_compound}\ \mathbf{then} \\ \quad \mathit{i\_compoundExpressionConstraint}'\ \mathit{ss}\ (\mathit{subExpr\_compound}^{\sim}\ \mathit{sec}) \\ \mathbf{else} \\ \quad \mathit{i\_refinedExpressionConstraint}'\ \mathit{ss}\ (\mathit{subExpr\_refined}^{\sim}\ \mathit{sec}) \end{array}$$

3.3 refinement

A refinement contains all the grouped and ungrouped attributes that refine the set of clinical meanings satisfied by the expression constraint. Refinements may represent the conjunction or disjunction of two smaller refinements, and may optionally be placed in brackets. Where both conjunction and disjunction are used, brackets are mandatory to disambiguate the intended meaning.

refinement = subRefinement ws [conjunctionRefinementSet / disjunctionRefinementSet]

The interpretation of REFINEMENT is one of:

- The intersection of the interpretation of the SUBREFINEMENT and the CONJUNCTIONREFINEMENTSET
- The union of the interpretation of the SUBREFINEMENT and the DISJUNCTIONREFINEMENTSET
- The interpretation of SUBREFINEMENT if neither conjunction nor disjunction set is present

$\mathit{refinement} == \mathit{subRefinement} \times \mathit{refinementConjunctionOrDisjunction}[0 \mathrel{..} 1]$
$[\mathit{refinement}']$

$refinementConjunctionOrDisjunction ::=$
$\quad refine\_conjset \langle\langle conjunctionRefinementSet \rangle\rangle \mid$
$\quad refine\_disjset \langle\langle disjunctionRefinementSet \rangle\rangle$

$$
\begin{array}{l}
i\_refinement : Substrate \rightarrow refinement \rightarrow Sctids\_or\_Error \\
\hline
\forall\, ss : Substrate;\ rfnment : refinement \bullet \\
i\_refinement\ ss\ rfnment = \\
(\mathbf{let}\ lhs == i\_subRefinement\ ss\ (first\ rfnment);\ rhs == second\ rfnment \bullet \\
\mathbf{if}\ \#rhs = 0\ \mathbf{then} \\
\quad lhs \\
\mathbf{else\ if}\ (head\ rhs) \in \operatorname{ran} refine\_conjset\ \mathbf{then} \\
\quad intersect\ lhs\ (i\_conjunctionRefinementSet\ ss\ (refine\_conjset^{\sim}(head\ rhs))) \\
\mathbf{else} \\
\quad union\ lhs\ (i\_disjunctionRefinementSet\ ss\ (refine\_disjset^{\sim}(head\ rhs))))
\end{array}
$$

$$
i\_refinement' : Substrate \rightarrow refinement' \rightarrow Sctids\_or\_Error
$$

3.3.1 conjunctionRefinementSet

A conjunction refinement set consists of one or more conjunction operators, each followed by a subRefinement.

```
conjunctionRefinementSet = 1*(ws conjunction ws subRefinement)
```

$conjunctionRefinementSet == \mathrm{seq}_1\ subRefinement$

The interpretation of a CONJUNCTIONREFINEMENTSET is the <u>intersection</u> of the interpretation of the SUBREFINEMENTS .

$$
\begin{array}{l}
i\_conjunctionRefinementSet : \\
\quad Substrate \rightarrow conjunctionRefinementSet \rightarrow Sctids\_or\_Error \\
\hline
\forall\, ss : Substrate;\ conjset : conjunctionRefinementSet \bullet \\
i\_conjunctionRefinementSet\ ss\ conjset = \\
\mathbf{if}\ tail\ conjset = \langle\rangle\ \mathbf{then} \\
\quad i\_subRefinement\ ss\ (head\ conjset) \\
\mathbf{else} \\
\quad intersect\ (i\_subRefinement\ ss\ (head\ conjset))\ (i\_conjunctionRefinementSet\ ss\ (tail\ conjset))
\end{array}
$$

3.3.2 disjunctionRefinementSet

```
disjunctionRefinementSet = 1*(ws disjunction ws subRefinement)
```

$$disjunctionRefinementSet == \mathrm{seq}_1\ subRefinement$$

The interpretation of a DISJUNCTIONREFINEMENTSET is the <u>union</u> of the interpretation of the SUBREFINEMENTS .

$$
\begin{array}{l}
i\_disjunctionRefinementSet : \\
\quad Substrate \rightarrow disjunctionRefinementSet \rightarrow Sctids\_or\_Error \\
\hline
\forall\, ss : Substrate;\ disjset : disjunctionRefinementSet \bullet \\
i\_disjunctionRefinementSet\ ss\ disjset = \\
\mathbf{if}\ tail\ disjset = \langle\rangle\ \mathbf{then} \\
\quad i\_subRefinement\ ss\ (head\ disjset) \\
\mathbf{else} \\
\quad union\ (i\_subRefinement\ ss\ (head\ disjset))\ (i\_disjunctionRefinementSet\ ss\ (tail\ disjset))
\end{array}
$$

3.3.3 subRefinement

A subRefinement is either an attribute set, an attribute group or a bracketed refinement.

```
subRefinement = attributeSet / attributeGroup / "(" ws refinement ws ")"
```

The interpretation of a SUBREFINEMENT is the interpretation of the corresponding ATTRIBUTESET , ATTRIBUTEGROUP or REFINEMENT .

$$
\begin{array}{l}
subRefinement ::= \\
\quad subrefine\_attset\langle\!\langle attributeSet\rangle\!\rangle \mid \\
\quad subrefine\_attgroup\langle\!\langle attributeGroup\rangle\!\rangle \mid \\
\quad subrefine\_refinement\langle\!\langle refinement'\rangle\!\rangle
\end{array}
$$

$$
\begin{array}{l}
i\_subRefinement : \\
\qquad Substrate \rightarrow subRefinement \rightarrow Sctids\_or\_Error \\
\hline
\forall\, ss : Substrate;\ subrefine : subRefinement \bullet \\
i\_subRefinement\ ss\ subrefine = \\
\mathbf{if}\ subrefine \in \mathrm{ran}\ subrefine\_attset\ \mathbf{then} \\
\quad i\_attributeSet\ ss\ (subrefine\_attset^{\sim}\ subrefine) \\
\mathbf{else\ if}\ subrefine \in \mathrm{ran}\ subrefine\_attgroup\ \mathbf{then} \\
\quad i\_attributeGroup\ ss\ (subrefine\_attgroup^{\sim}\ subrefine) \\
\mathbf{else} \\
\quad i\_refinement'\ ss\ (subrefine\_refinement^{\sim}\ subrefine)
\end{array}
$$

3.4 attributeSet

An attribute set contains one or more attribute name-value pairs separated by a conjunction or disjunction operator. An attribute set may optionally be placed in brackets.

attributeSet = subAttributeSet ws [conjunctionAttributeSet / disjunctionAttributeSet]

The interpretation of an ATTRIBUTESET is one of:

- The intersection of the interpretation of the SUBATTRIBUTESET and the CONJUNCTIONATTRIBUTESET
- The union of the interpretation of the SUBATTRIBUTESET and the DISJUNCTIONATTRIBUTESET
- The interpretation of SUBATTRIBUTESET if neither conjunction nor disjunction set is present

$$attributeSet == subAttributeSet \times conjunctionOrDisjunctionAttributeSet[0 \mathrel{..} 1]$$

$$[attributeSet']$$

$$\begin{aligned}
&conjunctionOrDisjunctionAttributeSet ::= \\
&\quad attset_conjattset \langle\langle conjunctionAttributeSet \rangle\rangle \mid \\
&\quad attset_disjattset \langle\langle disjunctionAttributeSet \rangle\rangle
\end{aligned}$$

$$\begin{aligned}
&i_attributeSet : \\
&\quad Substrate \rightarrow attributeSet \rightarrow Sctids_or_Error \\
\hline
&\forall ss : Substrate; \; attset : attributeSet \bullet \\
&i_attributeSet \; ss \; attset = \\
&(\mathbf{let} \; lhs == i_subAttributeSet \; ss \; (first \; attset); \; rhs == second \; attset \bullet \\
&\mathbf{if} \; \#rhs = 0 \; \mathbf{then} \\
&\quad lhs \\
&\mathbf{else\ if} \; head \; rhs \in \operatorname{ran} attset_conjattset \; \mathbf{then} \\
&\quad intersect \; lhs \; (i_conjunctionAttributeSet \; ss \; (attset_conjattset^{\sim}(head \; rhs))) \\
&\mathbf{else} \\
&\quad union \; lhs \; (i_disjunctionAttributeSet \; ss \; (attset_conjattset^{\sim}(head \; rhs))))
\end{aligned}$$

$$\begin{aligned}
&i_attributeSet' : \\
&\quad Substrate \rightarrow attributeSet' \rightarrow Sctids_or_Error
\end{aligned}$$

3.4.1 conjunctionAttributeSet

> *A conjunction attribute set consists of one or more conjunction operators, each followed by a subAttributeSet.*

```
conjunctionAttributeSet = 1*(ws conjunction ws subAttributeSet)
```

The interpretation of a CONJUNCTIONATTRIBUTESET is the intersection of the interpretations of its SUBATTRIBUTESETS .

$$conjunctionAttributeSet == \mathrm{seq}_1\ subAttributeSet$$

$$\begin{array}{l}
i_conjunctionAttributeSet : \\
\quad Substrate \rightarrow conjunctionAttributeSet \rightarrow Sctids_or_Error \\
\hline
\forall\, ss : Substrate;\ conjset : conjunctionAttributeSet \bullet \\
i_conjunctionAttributeSet\ ss\ conjset = \\
\mathbf{if}\ tail\ conjset = \langle\rangle\ \mathbf{then} \\
\quad i_subAttributeSet\ ss\ (head\ conjset) \\
\mathbf{else} \\
\quad intersect\ (i_subAttributeSet\ ss\ (head\ conjset))\ (i_conjunctionAttributeSet\ ss\ (tail\ conjset))
\end{array}$$

3.4.2 disjunctionAttributeSet

> *A disjunction attribute set consists of one or more disjunction operators, each followed by a subAttributeSet.*

```
disjunctionAttributeSet = 1*(ws disjunction ws subAttributeSet)
```

The interpretation of a DISJUNCTIONATTRIBUTESET is the union of the interpretations of its SUBATTRIBUTESETS .

$$disjunctionAttributeSet == \mathrm{seq}_1\ subAttributeSet$$

$$\begin{array}{l}
i_disjunctionAttributeSet : \\
\quad Substrate \rightarrow disjunctionAttributeSet \rightarrow Sctids_or_Error \\
\hline
\forall\, ss : Substrate;\ disjset : disjunctionAttributeSet \bullet \\
i_disjunctionAttributeSet\ ss\ disjset = \\
\mathbf{if}\ tail\ disjset = \langle\rangle\ \mathbf{then} \\
\quad i_subAttributeSet\ ss\ (head\ disjset) \\
\mathbf{else} \\
\quad union\ (i_subAttributeSet\ ss\ (head\ disjset))\ (i_disjunctionAttributeSet\ ss\ (tail\ disjset))
\end{array}$$

3.4.3 subAttributeSet

A subAttributeSet is either an attribute or a bracketed attribute set.

subAttributeSet = attribute / "(" ws attributeSet ws ")"

The interpretation of a SUBATTRIBUTESET is either the interpretation of the ATTRIBUTE or the interpretation of the ATTRIBUTESET .

$$
\begin{array}{l}
\mathit{subAttributeSet} ::= \\
\quad \mathit{subaset\_attribute}\langle\!\langle \mathit{attribute} \rangle\!\rangle \mid \\
\quad \mathit{subaset\_attset}\langle\!\langle \mathit{attributeSet}' \rangle\!\rangle
\end{array}
$$

$$
\begin{array}{l}
\mathit{i\_subAttributeSet} : \\
\qquad \mathit{Substrate} \rightarrow \mathit{subAttributeSet} \rightarrow \mathit{Sctids\_or\_Error} \\
\hline
\forall\, \mathit{ss} : \mathit{Substrate};\ \mathit{subaset} : \mathit{subAttributeSet} \bullet \\
\mathit{i\_subAttributeSet}\ \mathit{ss}\ \mathit{subaset} = \\
\textbf{if}\ \mathit{subaset} \in \operatorname{ran} \mathit{subaset\_attribute}\ \textbf{then} \\
\quad \mathit{i\_attribute}\ \mathit{ss}\ (\mathit{subaset\_attribute}^{\sim}\, \mathit{subaset}) \\
\textbf{else} \\
\quad \mathit{i\_attributeSet}'\ \mathit{ss}\ (\mathit{subaset\_attset}^{\sim}\, \mathit{subaset})
\end{array}
$$

3.5 attribute

An attribute is a name-value pair expressing a single refinement of the containing expression constraint. Either the attribute value must satisfy (or not) the given expression constraint, the attribute value is compared with a given numeric value (integer or decimal) using a numeric comparison operator, or the attribute value must be equal to (or not equal to) the given string value. The attribute may optionally be preceded by a cardinality constraint, a reverse flag and/or an attribute operator.

attribute = [cardinality ws] [reverseFlag ws] [attributeOperator ws] attributeName ws (expressionComparisonOperator ws expressionConstraintValue / numericComparisonOperator ws numericValue / stringComparisonOperator ws stringValue numericValue = "#" (decimalValue / integerValue)

Conceptually, the interpretation of ATTRIBUTE consists of the following steps:

1. Interpret ATTRIBUTENAME

2. Interpret ATTRIBUTEOPERATOR against the result of the previous step
3. Interpret one of:
   - The EXPRESSIONCOMPARISONOPERATOR applied to the REVERSEFLAG , the interpretation of ATTRIBUTEOPERATOR and EXPRESSIONCONSTRAINTVALUE .
   - The NUMERICCOMPARISONOPERATOR applied to the interpretation of ATTRIBUTEOPERATOR and NUMERICVALUE .
   - The STRINGCOMPARISONOPERATOR applied to the interpretation of ATTRIBUTEOPERATOR and STRINGVALUE .
4. Interpret CARDINALITY against the result of the previous step

Note that the REVERSEFLAG only applies in the case of EXPRESSIONCOMPARISONOPERATOR . Not sure what to do if it is present in the other two cases...

The schema below provides names the various components of an attribute.

attribute

$card : cardinality[0 \mathinner{\ldotp\ldotp} 1]$
$rf : reverseFlag[0 \mathinner{\ldotp\ldotp} 1]$
$attOper : constraintOperator[0 \mathinner{\ldotp\ldotp} 1]$
$name : attributeName$
$opValue : attributeOperatorValue$

$$
\begin{aligned}
attributeOperatorValue ::= \\
&\quad attrib\_expr\langle\langle expressionComparisonOperator \times expressionConstraintValue\rangle\rangle \mid \\
&\quad attrib\_num\langle\langle numericComparisonOperator \times numericValue\rangle\rangle \mid \\
&\quad attrib\_str\langle\langle stringComparisonOperator \times stringValue\rangle\rangle
\end{aligned}
$$

$$numericValue ::= nv\_decimal\langle\langle decimalValue\rangle\rangle \mid nv\_integer\langle\langle \mathbb{N}\rangle\rangle$$

$$[reverseFlag]$$

$$
\begin{array}{l}
i\_attribute : \\
\quad Substrate \rightarrow attribute \rightarrow Sctids\_or\_Error \\
\hline
\forall\, ss : Substrate;\ att : attribute \bullet \\
i\_attribute\ ss\ att = \\
(\mathbf{let}\ att\_sctids == i\_attributeOperator\ ss\ att.attOper\ (ss.i\_attributeName\ att.name) \bullet \\
\mathbf{if}\ att\_sctids \in \operatorname{ran} error\ \mathbf{then} \\
\quad att\_sctids \\
\mathbf{else\ if}\ att.opValue \in \operatorname{ran} attrib\_expr\ \mathbf{then} \\
\quad (\mathbf{let}\ expr\_interp == \\
\quad i\_expressionComparisonOperator\ ss\ att.rf\ (result\_sctids\ att\_sctids)\ (attrib\_expr^{\sim}\ att.opValue) \bullet \\
\qquad i\_att\_cardinality\ ss\ att.card\ expr\_interp) \\
\mathbf{else\ if}\ att.opValue \in \operatorname{ran} attrib\_num \\
\quad \mathbf{then} \\
\quad (\mathbf{let}\ num\_interp == \\
\quad i\_numericComparisonOperator\ ss\ att.rf\ (result\_sctids\ att\_sctids)\ (attrib\_num^{\sim}\ att.opValue) \bullet \\
\qquad i\_att\_cardinality\ ss\ att.card\ num\_interp) \\
\mathbf{else} \\
\quad (\mathbf{let}\ str\_interp == \\
\quad i\_stringComparisonOperator\ ss\ att.rf\ (result\_sctids\ att\_sctids)\ (attrib\_str^{\sim}\ att.opValue) \bullet \\
\qquad i\_att\_cardinality\ ss\ att.card\ str\_interp))
\end{array}
$$

3.5.1 attribute cardinality

The cardinality of an attribute represents a constraint on the minimum and maximum number of instances of the given attribute on each concept. The cardinality is enclosed in square brackets with the minimum cardinality appearing first, followed by two dots and then the maximum cardinality. The minimum cardinality must always be less than or equal to the maximum cardinality. A maximum cardinality of 'many' indicates that there is no limit on the number of times the attribute may appear on each concept.

```
cardinality = "[" nonNegativeIntegerValue to (nonNegativeIntegerValue / many) "]"
```

$$
\begin{array}{l}
unlimitedNat ::= num\langle\!\langle \mathbb{N} \rangle\!\rangle \mid many \\
cardinality == \mathbb{N} \times unlimitedNat
\end{array}
$$

The interpretation of $optional[cardinality]$ in the context of an attribute is:

1. $error$ if there is an error in the supplied list of quads
2. $i\_required\_cardinality\ 1\ many$ if the cardinality isn't supplied

3. *i_required_cardinality cardinality* if the minimum cardinality is > 0
4. *i_optionali_cardinality ss cardinality* if the minimum cardinality $= 0$

$$
\begin{array}{|l}
\hline
i\_att\_cardinality : \\
\quad Substrate \rightarrow cardinality[0\,..\,1] \rightarrow Quads\_or\_Error \rightarrow Sctids\_or\_Error \\
\hline
\forall\, ss : Substrate;\ ocard : cardinality[0\,..\,1];\ qore : Quads\_or\_Error \bullet \\
i\_att\_cardinality\ ss\ ocard\ qore = \\
\mathbf{if}\ qore \in \operatorname{ran} qerror\ \mathbf{then} \\
\quad error(qerror^{\sim}\, qore) \\
\mathbf{else\ if}\ \#ocard = 0\ \mathbf{then} \\
\quad ok\ (i\_required\_cardinality\ 1\ many\ qore) \\
\mathbf{else\ if}\ first\ (head\ ocard) > 0\ \mathbf{then} \\
\quad ok\ (i\_required\_cardinality\ (first\ (head\ ocard))\ (second\ (head\ ocard))\ qore) \\
\mathbf{else} \\
\quad ok\ (i\_optional\_cardinality\ ss\ (second\ (head\ ocard))\ qore) \\
\hline
\end{array}
$$

i_required_cardinality returns the set of subject or target sctids that meet the cardinality requirements

$$
\begin{array}{|l}
\hline
i\_required\_cardinality : \\
\quad \mathbb{N} \rightarrow unlimitedNat \rightarrow Quads\_or\_Error \ \rightarrow \mathbb{P}\, sctId \\
\hline
\forall\, min : \mathbb{N};\ max : unlimitedNat;\ qore : Quads\_or\_Error \bullet \\
i\_required\_cardinality\ min\ max\ qore = \\
\mathbf{if}\ quad\_direction\ qore = source\_direction\ \mathbf{then} \\
\quad \{subj : \{q : quads\_for\ qore \bullet q.s\} \mid \\
\quad evalCardinality[Quad]\ min\ max\ \{q : quads\_for\ qore \mid q.s = subj\} \neq \emptyset\} \\
\mathbf{else} \\
\quad \{targ : \{q : quads\_for\ qore \bullet t\_sctid^{\sim}\, q.t\} \mid \\
\quad evalCardinality[Quad]\ min\ max\ \{q : quads\_for\ qore \mid (t\_sctid^{\sim}\, q.t) = targ\} \neq \emptyset\} \\
\hline
\end{array}
$$

i_optional_cardinality returns all of the concepts in the substrate that don't *fail* the cardinality test. The failing concepts are equivalent to the set of all subject (or target) concepts in the set of quads minus the set of concepts that pass.

$$
\begin{array}{|l}
\hline
i\_optional\_cardinality : \\
\quad Substrate \rightarrow unlimitedNat \rightarrow Quads\_or\_Error \ \rightarrow \mathbb{P}\, sctId \\
\hline
\forall\, ss : Substrate;\ max : unlimitedNat;\ qore : Quads\_or\_Error \bullet \\
i\_optional\_cardinality\ ss\ max\ qore = \\
\mathbf{if}\ quad\_direction\ qore = source\_direction\ \mathbf{then} \\
\quad ss.concepts \setminus (\{q : quads\_for\ qore \bullet q.s\} \setminus (i\_required\_cardinality\ 0\ max\ qore)) \\
\mathbf{else} \\
\quad ss.concepts \setminus (\{q : quads\_for\ qore \bullet t\_sctid^{\sim}\, q.t\} \setminus (i\_required\_cardinality\ 0\ max\ qore)) \\
\hline
\end{array}
$$

3.5.2 expressionConstraintValue

An expression constraint value is either a simple expression constraint, or is a refined or compound expression constraint enclosed in brackets.

expressionConstraintValue = simpleExpressionConstraint / "(" ws (refinedExpressionConstraint / compoundExpressionConstraint) ws ")"

The interpretation of EXPRESSIONCONSTRAINTVALUE is the interpretation of the corresponding SIMPLEEXPRESSIONCONSTRAINT , REFINEDEXPRESSIONCONSTRAINT or COMPOUNDEXPRESSIONCONSTRAINT

$$\begin{aligned}
&expressionConstraintValue ::= \\
&\quad expression_simple\langle\langle simpleExpressionConstraint\rangle\rangle \mid \\
&\quad expression_refined\langle\langle refinedExpressionConstraint'\rangle\rangle \mid \\
&\quad expression_compound\langle\langle compoundExpressionConstraint\rangle\rangle
\end{aligned}$$

$$\begin{aligned}
&i_expressionConstraintValue : \\
&\quad Substrate \to expressionConstraintValue \to Sctids_or_Error \\
\hline
&\forall\, ss : Substrate;\ ecv : expressionConstraintValue \bullet \\
&i_expressionConstraintValue\ ss\ ecv = \\
&\textbf{if}\ ecv \in \operatorname{ran} expression_simple\ \textbf{then} \\
&\quad i_simpleExpressionConstraint\ ss\ (expression_simple^{\sim}\ ecv) \\
&\textbf{else if}\ ecv \in \operatorname{ran} expression_refined\ \textbf{then} \\
&\quad i_refinedExpressionConstraint'\ ss\ (expression_refined^{\sim}\ ecv) \\
&\textbf{else} \\
&\quad i_compoundExpressionConstraint\ ss\ (expression_compound^{\sim}\ ecv)
\end{aligned}$$

3.6 attributeGroup

An attribute group contains a collection of attributes that operate together as part of the refinement of the containing expression constraint. An attribute group may optionally be preceded by a cardinality. An attribute group cardinality indicates the minimum and maximum number of attribute groups that must satisfy the given attributeSet constraint for the expression constraint to be satisfied.

attributeGroup = [cardinality ws] "{" ws attributeSet ws "}"

$$attributeGroup == cardinality[0\,..\,1] \times attributeSet$$

The difference between the interpretation of an ATTRIBUTEGROUP and an ATTRIBUTESET is that, within an ATTRIBUTEGROUP all of the qualifying SCTIDS must belong to the same *non-zero* group. Outside, a SCTID would qualify an conjunction if one group passed the first match and a different one the second. *Within* a group, however, conjunctions and disjunctions only count if they both apply in the same group. This means that we have to re-interpret the meaning of ATTRIBUTESET on down in terms of *IDGroups* rather than *Quads*

The interpretation of an attribute group is the application of a cardinality constraint to all of the *sctIds* that pass the grouped attribute set.

$$i\_attributeGroup : Substrate \rightarrow attributeGroup \rightarrow Sctids\_or\_Error$$

$$\forall ss : Substrate;\ ag : attributeGroup \bullet$$
$$i\_attributeGroup\ ss\ ag =$$
$$\quad i\_group\_cardinality\ ss\ (first\ ag)\ (i\_groupAttributeSet\ ss\ (second\ ag))$$

3.6.1 attribute group cardinality

The interpretation of CARDINALITY within the context of an attribute group is as follows:

- If an error has been encountered anywhere in the process, it should be propagated.
- If the cardinality is omitted, it is interpreted as [1 .. *]
- If the minimum cardinality is >then return the set of sctids with that appear at least *min* and at most *max* groups
- If the minimum cardinality is 0 then return every sctid that doesn't fail the max cardinality

$$i\_group\_cardinality :$$
$$\quad Substrate \rightarrow cardinality[0\mathinner{..}1] \rightarrow sctIdGroups\_or\_Error \rightarrow Sctids\_or\_Error$$

$$\forall ss : Substrate;\ ocard : cardinality[0\mathinner{..}1];\ idg : sctIdGroups\_or\_Error \bullet$$
$$i\_group\_cardinality\ ss\ ocard\ idg =$$
$$\mathbf{if}\ idg \in \operatorname{ran} gerror\ \mathbf{then}$$
$$\quad error(gerror^{\sim} idg)$$
$$\mathbf{else}\ (\mathbf{let}\ gvals == group\_value^{\sim} idg \bullet$$
$$\quad \mathbf{if}\ \#ocard = 0\ \mathbf{then}$$
$$\quad\quad ok(i\_required\_group\_cardinality\ 1\ many\ gvals)$$
$$\quad \mathbf{else\ if}\ first\ (head\ ocard) > 0\ \mathbf{then}$$
$$\quad\quad ok(i\_required\_group\_cardinality\ (first\ (head\ ocard))\ (second\ (head\ ocard))\ gvals)$$
$$\quad \mathbf{else}$$
$$\quad\quad ok(i\_optional\_group\_cardinality\ ss\ (second\ (head\ ocard))\ gvals))$$

$i\_required\_group\_cardinality$ returns the set $sctids$ that pass in at least min groups and at most max groups

$$
\begin{array}{l}
i\_required\_group\_cardinality : \\
\quad \mathbb{N} \to unlimitedNat \to \mathbb{P}\, sctIdGroup \to \mathbb{P}\, sctId \\
\hline
\forall\, min : \mathbb{N};\ max : unlimitedNat;\ groups : \mathbb{P}\, sctIdGroup \bullet \\
i\_required\_group\_cardinality\ min\ max\ groups = \\
\{ sctid : \{ s : groups \bullet first\ s \} \mid \\
\quad evalCardinality[sctIdGroup]\ min\ max \{ g : groups \mid first\ g = sctid \} \neq \emptyset \}
\end{array}
$$

$i\_optional\_group\_cardinality$ returns the set of $sctids$ that pass in at most max groups, which is equivalent to the set of all possible $sctIds$ (i.e. $ss.concepts$) minus the set of $sctids$ that pass in more than max groups.

$$
\begin{array}{l}
i\_optional\_group\_cardinality : \\
\quad Substrate \to unlimitedNat \to \mathbb{P}\, sctIdGroup \to \mathbb{P}\, sctId \\
\hline
\forall\, ss : Substrate;\ max : unlimitedNat;\ groups : \mathbb{P}\, sctIdGroup \bullet \\
i\_optional\_group\_cardinality\ ss\ max\ groups = \\
ss.concepts \setminus \\
\quad (\{ s : groups \bullet first\ s \} \setminus (i\_required\_group\_cardinality\ 0\ max\ groups))
\end{array}
$$

3.6.2 attributeSet inside a groups

The interpretation of an ATTRIBUTESET a group is the interpretation of the SUBATTRIBUTESET optionally intersected or union with additional conjunction or disjunction attribute sets.

$$
\begin{array}{l}
i\_groupAttributeSet : \\
\quad Substrate \to attributeSet \to sctIdGroups\_or\_Error \\
\hline
\forall\, ss : Substrate;\ attset : attributeSet \bullet \\
i\_groupAttributeSet\ ss\ attset = \\
(\mathbf{let}\ lhs == i\_groupSubAttributeSet\ ss\ (first\ attset);\ rhs == second\ attset \bullet \\
\mathbf{if}\ \#rhs = 0\ \mathbf{then} \\
\quad lhs \\
\mathbf{else\ if}\ head\ rhs \in \mathrm{ran}\ attset\_conjattset\ \mathbf{then} \\
\quad gintersect\ lhs\ (i\_groupConjunctionAttributeSet\ ss\ (attset\_conjattset^{\sim}(head\ rhs))) \\
\mathbf{else} \\
\quad gunion\ lhs\ (i\_groupDisjunctionAttributeSet\ ss\ (attset\_conjattset^{\sim}(head\ rhs))))
\end{array}
$$

$$
\begin{array}{l}
i\_groupAttributeSet' : \\
\quad Substrate \to attributeSet' \to sctIdGroups\_or\_Error
\end{array}
$$

3.6.3 conjunctionAttributeSet inside a group

Apply the intersect operator to the interpretation of each subAttributeSet in a group context. This is the same as the non-grouped *subAttributeSet* with the exception that the inputs to and result of the function is *sctId* / *groupId* tuples rather than

$$
\begin{array}{l}
i\_groupConjunctionAttributeSet : \\
\quad Substrate \rightarrow conjunctionAttributeSet \rightarrow sctIdGroups\_or\_Error \\
\hline
\forall\, ss : Substrate;\ conjset : conjunctionAttributeSet \bullet \\
i\_groupConjunctionAttributeSet\ ss\ conjset = \\
\textbf{if}\ tail\ conjset = \langle\rangle\ \textbf{then} \\
\quad i\_groupSubAttributeSet\ ss\ (head\ conjset) \\
\textbf{else} \\
\quad gintersect\ (i\_groupSubAttributeSet\ ss\ (head\ conjset))\ (i\_groupConjunctionAttributeSet\ ss\ (tail\ conj
\end{array}
$$

3.6.4 disjunctionAttributeSet inside a group

Apply the union operator to the interpretation of each subAttributeSet in a group context. This is the same as the non-grouped *subAttributeSet* with the exception that the inputs to and result of the function is *sctId* / *groupId* tuples rather than just *sctIds*.

$$
\begin{array}{l}
i\_groupDisjunctionAttributeSet : \\
\quad Substrate \rightarrow disjunctionAttributeSet \rightarrow sctIdGroups\_or\_Error \\
\hline
\forall\, ss : Substrate;\ disjset : disjunctionAttributeSet \bullet \\
i\_groupConjunctionAttributeSet\ ss\ disjset = \\
\textbf{if}\ tail\ disjset = \langle\rangle\ \textbf{then} \\
\quad i\_groupSubAttributeSet\ ss\ (head\ disjset) \\
\textbf{else} \\
\quad gunion\ (i\_groupSubAttributeSet\ ss\ (head\ disjset))\ (i\_groupConjunctionAttributeSet\ ss\ (tail\ disjset))
\end{array}
$$

3.6.5 subAttributeSet inside a group

This is the same as the non-grouped *subAttributeSet* with the exception that the result of the function is *sctId* / *groupId* tuples rather than just *sctIds*.

$$
\begin{array}{l}
i\_groupSubAttributeSet : \\
\qquad Substrate \rightarrow subAttributeSet \rightarrow sctIdGroups\_or\_Error \\
\hline
\forall\, ss : Substrate;\ subaset : subAttributeSet \bullet \\
i\_groupSubAttributeSet\ ss\ subaset = \\
\textbf{if}\ subaset \in \operatorname{ran} subaset\_attribute \\
\quad \textbf{then}\ i\_groupAttribute\ ss\ (subaset\_attribute^{\sim}\, subaset) \\
\textbf{else}\ i\_groupAttributeSet'\ ss\ (subaset\_attset^{\sim}\, subaset)
\end{array}
$$

3.6.6 attribute inside a group

The interpretation of an attribute within the context of a group is the set of *sctIds* and the group or groups in which they were valid. It is possible for the same *sctId* to valid in the interpretation of a given attribute for more than one group. The union and intersection operators operate on the *sctId* / *groupId* tuples (ne. *sctIdGroup*).

$$
\begin{array}{l}
i\_groupAttribute : \\
\quad Substrate \rightarrow attribute \rightarrow sctIdGroups\_or\_Error \\
\hline
\forall\, ss : Substrate;\ att : attribute \bullet \\
i\_groupAttribute\ ss\ att = \\
(\mathbf{let}\ att\_sctids == i\_attributeOperator\ ss\ att.attOper\ (ss.i\_attributeName\ att.name) \bullet \\
\mathbf{if}\ att\_sctids \in \mathrm{ran}\ error \\
\quad \mathbf{then}\ gerror(error^{\sim}\ att\_sctids) \\
\mathbf{else\ if}\ att.opValue \in \mathrm{ran}\ attrib\_expr\ \mathbf{then} \\
\quad (\mathbf{let}\ expr\_interp == \\
\quad i\_expressionComparisonOperator\ ss\ att.rf\ (result\_sctids\ att\_sctids)\ (attrib\_expr^{\sim}\ att.opValue) \bullet \\
\quad\quad i\_att\_group\_cardinality\ ss\ att.card\ expr\_interp) \\
\mathbf{else\ if}\ att.opValue \in \mathrm{ran}\ attrib\_num\ \mathbf{then} \\
\quad (\mathbf{let}\ num\_interp == \\
\quad i\_numericComparisonOperator\ ss\ att.rf\ (result\_sctids\ att\_sctids)\ (attrib\_num^{\sim}\ att.opValue) \bullet \\
\quad\quad i\_att\_group\_cardinality\ ss\ att.card\ num\_interp) \\
\mathbf{else} \\
\quad (\mathbf{let}\ str\_interp == \\
\quad i\_stringComparisonOperator\ ss\ att.rf\ (result\_sctids\ att\_sctids)\ (attrib\_str^{\sim}\ att.opValue) \bullet \\
\quad\quad i\_att\_group\_cardinality\ ss\ att.card\ str\_interp))
\end{array}
$$

3.6.7 cardinality inside a group

Cardinality is interpreted differently within the context of a a group. In particular:

- Only non-zero groups are evaluated.
- A sctid can pass in the context of more than one group

i_att_group_cardinality takes an optional cardinality and a set of quads and returns a list sctids and the groups in which they passed the cardinality constraint.

$$
\begin{array}{l}
i\_att\_group\_cardinality : \\
\quad Substrate \rightarrow cardinality[0\,..\,1] \rightarrow Quads\_or\_Error \rightarrow sctIdGroups\_or\_Error \\
\hline
\forall\, ss : Substrate;\ ocard : cardinality[0\,..\,1];\ qore : Quads\_or\_Error \bullet \\
i\_att\_group\_cardinality\ ss\ ocard\ qore = \\
\mathbf{if}\ qore \in \operatorname{ran} qerror\ \mathbf{then} \\
\quad gerror(qerror^{\sim} qore) \\
\mathbf{else\ if}\ \#ocard = 0\ \mathbf{then} \\
\quad group\_value\ (i\_required\_att\_group\_cardinality\ 1\ many\ qore) \\
\mathbf{else\ if}\ first\ (head\ ocard) > 0\ \mathbf{then} \\
\quad group\_value\ (i\_required\_att\_group\_cardinality\ (first\ (head\ ocard))\ (second\ (head\ ocard))\ qore) \\
\mathbf{else} \\
\quad group\_value\ (i\_optional\_att\_group\_cardinality\ ss\ (second\ (head\ ocard))\ qore)
\end{array}
$$

$i\_required\_att\_group\_cardinality$ returns the set of subject or target sctids combined with the group(s) in which they qualified

$$
\begin{array}{l}
i\_required\_att\_group\_cardinality : \\
\quad \mathbb{N} \rightarrow unlimitedNat \rightarrow Quads\_or\_Error \ \rightarrow \mathbb{P}\, sctIdGroup \\
\hline
\forall\, min : \mathbb{N};\ max : unlimitedNat;\ qore : Quads\_or\_Error \bullet \\
i\_required\_att\_group\_cardinality\ min\ max\ qore = \\
\mathbf{if}\ quad\_direction\ qore = source\_direction\ \mathbf{then} \\
\quad \{subjgroup : \{q : quads\_for\ qore \mid q.g \neq zero\_group \bullet (q.s, q.g)\} \mid \\
\quad evalCardinality[Quad]\ min\ max\ \{q : quads\_for\ qore \mid \\
\qquad q.s = first\ subjgroup \wedge q.g = second\ subjgroup\} \neq \emptyset\} \\
\mathbf{else} \\
\quad \{targgroup : \{q : quads\_for\ qore \mid \\
\qquad q.g \neq zero\_group \wedge q.t \in \operatorname{ran} t\_sctid \bullet (t\_sctid^{\sim} q.t, q.g)\} \mid \\
\quad evalCardinality[Quad]\ min\ max\ \{q : quads\_for\ qore \mid \\
\qquad t\_sctid^{\sim} q.t = first\ targgroup \wedge q.g = second\ targgroup\} \neq \emptyset\}
\end{array}
$$

$i\_optional\_att\_group\_cardinality$ returns the set of subject or target sctids along with all of the corresponding groups that *fail* the cardinality test. The failing list is equivalent to the set of all possible sctid / non-zero groups in the substrate minus the set of sctid / non-zero groups that fail the maximum cardinality. The set of failures is determined by removing the set of passing tuples from the total possible set in the supplied quads.

$$
\begin{array}{l}
i\_optional\_att\_group\_cardinality : \\
\quad Substrate \rightarrow unlimitedNat \rightarrow Quads\_or\_Error \ \rightarrow \mathbb{P}\, sctIdGroup \\
\hline
\forall\, ss : Substrate;\ max : unlimitedNat;\ qore : Quads\_or\_Error \bullet \\
i\_optional\_att\_group\_cardinality\ ss\ max\ qore = \\
\mathbf{if}\ quad\_direction\ qore = source\_direction\ \mathbf{then} \\
\quad \{rel : ss.relationships \mid rel.g \neq zero\_group \bullet (rel.s, rel.g)\} \setminus \\
\quad \{q : quads\_for\ qore \mid q.g \neq zero\_group \bullet (q.s, q.g)\} \cup \\
\quad\quad i\_required\_att\_group\_cardinality\ 0\ max\ qore \\
\mathbf{else} \\
\quad \{rel : ss.relationships \mid rel.g \neq zero\_group \wedge rel.t \in \operatorname{ran} t\_sctid \bullet (t\_sctid^{\sim} rel.t, rel.g)\} \setminus \\
\quad \{q : quads\_for\ qore \mid q.g \neq zero\_group \bullet (t\_sctid^{\sim} q.t, q.g)\} \cup \\
\quad\quad i\_required\_att\_group\_cardinality\ 0\ max\ qore
\end{array}
$$

4 Substrate Interpretations

This section defines the interpretations that are realized against the substrate.

4.1 constraintOperator

A constraint operator is either 'descendantOrSelfOf', 'descendantOf', 'ancestorOrSelfOf', or 'ancestorOf'.

```
constraintOperator = descendantOrSelfOf / descendantOf / ancestorOrSelfOf / ancestorOf
```

The interpretation of $constraintOperator[0\,..\,1]$ is one of:

- The input if an operator isn't supplied or if it contains an error
- The union of descendants of all members of the input, as provided by the substrate if the operator is *descendantOf*
- The union of descendants plus the input if the operator is *descendantOrSelfOf*
- The union of ancestors of all members of the input, as provided by the substrate if the operator is *ancestorOf*
- The union of ancestors plus the input if the operator is *ancestorsOrSelfOf*

Note that it is possible for some or all of the members of the input to be included in the *descendantOf* or *ancestorOf* operations as the descendants of one input sctid may include another input sctid.

The *completeFun* function assures that an operation on any identifier that isn't in the domain of the substrate *descendants* or *ancestors* function returns the empty set ($\emptyset$).

$$constraintOperator ::= descendantOrSelfOf \mid descendantOf \mid ancestorOrSelfOf \mid ancestorOf$$

$$
\begin{array}{|l}
i\_constraintOperator : \\
\quad Substrate \rightarrow constraintOperator[0 \mathinner{..} 1] \rightarrow Sctids\_or\_Error \rightarrow Sctids\_or\_Error \\
completeFun : (sctId \rightarrow\!\!\!\!\!\!+ \; \mathbb{P}\, sctId) \rightarrow sctId \rightarrow \mathbb{P}\, sctId \\
\hline
\forall\, ss : Substrate;\; oco : constraintOperator[0 \mathinner{..} 1];\; input : Sctids\_or\_Error \bullet \\
i\_constraintOperator\; ss\; oco\; input = \\
\quad \mathbf{if}\; error^{\sim} input \in ERROR \lor \#oco = 0\; \mathbf{then} \\
\qquad input \\
\quad \mathbf{else\ if}\; head\; oco = descendantOrSelfOf\; \mathbf{then} \\
\qquad ok(\bigcup\{id : result\_sctids\; input \bullet \\
\qquad\quad completeFun\; ss.descendants\; id\} \cup result\_sctids\; input) \\
\quad \mathbf{else\ if}\; head\; oco = descendantOf\; \mathbf{then} \\
\qquad ok(\bigcup\{id : result\_sctids\; input \bullet \\
\qquad\quad completeFun\; ss.descendants\; id\,\}) \\
\quad \mathbf{else\ if}\; head\; oco = ancestorOrSelfOf\; \mathbf{then} \\
\qquad ok(\bigcup\{id : result\_sctids\; input \bullet \\
\qquad\quad completeFun\; ss.ancestors\; id\} \cup result\_sctids\; input) \\
\quad \mathbf{else} \\
\qquad ok(\bigcup\{id : result\_sctids\; input \\
\qquad\quad \bullet\; completeFun\; ss.ancestors\; id\,\}) \\
\forall\, f : (sctId \rightarrow\!\!\!\!\!\!+ \; \mathbb{P}\, sctId);\; id : sctId \bullet completeFun\, f\; id = \\
\quad \mathbf{if}\; id \in \operatorname{dom} f\; \mathbf{then}\; f\; id\; \mathbf{else}\; \emptyset
\end{array}
$$

4.2 attributeOperator

An attribute operator indicates that instead of just matching the named attribute with the given attribute value, any descendants of or any descendants or self of the named attribute may match the given attribute value.

```
attributeOperator = descendantOrSelfOf / descendantOf
```

The interpretation of *attributeOperator* is the same as the interpretation of *constraintOperator*

$$attributeOperator == constraintOperator$$
$$i\_attributeOperator == i\_constraintOperator$$

4.3 expressionComparisonOperator

> *Attributes whose value is a concept may be compared to an expression constraint using either equals ("=") or not equals ("!="). In the full syntax "¡¿" and "not =" (case insensitive) are also valid ways to represent not equals.*

```
expressionComparisonOperator = "=" / "!="
```

The interpretation of EXPRESSIONCOMPARISONOPERATOR is the set of all quads in the substrate having a target (or subject if the direction is reverse) that are (or are not) in the interpretation of the EXPRESSIONCONSTRAINTVALUE

$$expressionComparisonOperator ::= eco\_eq \mid eco\_neq$$

$$
\begin{array}{l}
i\_expressionComparisonOperator : \\
\quad Substrate \to reverseFlag[0 \mathrel{..} 1] \to \mathbb{P}\, sctId \to \\
\quad (expressionComparisonOperator \times expressionConstraintValue) \to Quads\_or\_Error \\
\hline
\forall\, ss : Substrate;\ rf : reverseFlag[0 \mathrel{..} 1];\ atts : \mathbb{P}\, sctId; \\
\quad ec : (expressionComparisonOperator \times expressionConstraintValue) \bullet \\
i\_expressionComparisonOperator\ ss\ rf\ atts\ ec = \\
(\mathbf{let}\ ecv == i\_expressionConstraintValue\ ss\ (second\ ec) \bullet \\
\quad \mathbf{if}\ ecv \in \operatorname{ran} error\ \mathbf{then} \\
\quad\quad qerror(error^{\sim}\, ecv) \\
\quad \mathbf{else\ if}\ \#reverseFlag = 0 \land (first\ ec = eco\_eq)\ \mathbf{then} \\
\quad\quad quad\_value(\{q : ss.relationships \mid \\
\quad\quad\quad q.t \in \operatorname{ran} t\_sctid \land (t\_sctid^{\sim}\, q.t) \in (result\_sctids\ ecv)\}, source\_direction) \\
\quad \mathbf{else\ if}\ \#reverseFlag > 0 \land (first\ ec = eco\_eq)\ \mathbf{then} \\
\quad\quad quad\_value(\{q : ss.relationships \mid \\
\quad\quad\quad q.s \in (result\_sctids\ ecv)\}, targets\_direction) \\
\quad \mathbf{else\ if}\ \#reverseFlag = 0 \land (first\ ec = eco\_neq)\ \mathbf{then} \\
\quad\quad quad\_value(\{q : ss.relationships \mid \\
\quad\quad\quad q.t \in \operatorname{ran} t\_sctid \land (t\_sctid^{\sim}\, q.t) \notin (result\_sctids\ ecv)\}, source\_direction) \\
\quad \mathbf{else} \\
\quad\quad quad\_value(\{q : ss.relationships \mid \\
\quad\quad\quad q.s \notin (result\_sctids\ ecv)\}, targets\_direction))
\end{array}
$$

4.4 numericComparisonOperator

> *Attributes whose value is numeric (i.e. integer or decimal) may be compared to a specific concrete value using a variety of comparison operators, including*

equals ("="), less than ("<"), less than or equals ("<="), greater than (">"), greater than or equals (">=") and not equals ("!="). In the full syntax "<>" and "not =" (case insensitive) are also valid ways to represent not equals.

```
numericComparisonOperator = "=" / "!=" / "<=" / "<" / ">=" / ">"
```

The interpretation of NUMERICCOMPARISONOPERATOR is the set of all quads in the substrate having a *concreteValue* target of type *cv_integer* or *cv_decimal* that (or do not meet) the supplied criteria. As concrete values cannot occur as subjects, this function returns the empty set if the reverse flag is supplied

$$numericComparisonOperator ::= nco\_eq \mid nco\_neq \mid nco\_gt \mid nco\_ge \mid nco\_lt \mid nco\_le$$

$$\begin{array}{l}
i_numericComparisonOperator : \\
\quad Substrate \rightarrow reverseFlag[0 \mathinner{..} 1] \rightarrow \mathbb{P}\, sctId \rightarrow \\
\quad (numericComparisonOperator \times numericValue) \rightarrow Quads_or_Error \\
\hline
\forall\, ss : Substrate;\ rf : reverseFlag[0 \mathinner{..} 1];\ atts : \mathbb{P}\, sctId; \\
\quad ncv : (numericComparisonOperator \times numericValue) \bullet \\
i_numericComparisonOperator\ ss\ rf\ atts\ ncv = \\
\textbf{if}\ \#rf > 0\ \textbf{then} \\
\quad quad_value(\emptyset, targets_direction) \\
\textbf{else} \\
\quad quad_value(\{q : ss.relationships \mid q.a \in atts \wedge q.t \in \operatorname{ran} t_concrete \wedge \\
numericComparison\,(t_concrete^{\sim}\, q.t)\,(first\ ncv) = (second\ ncv)\}, source_direction)
\end{array}$$

Numeric comparison function. Compares a *concreteValue* with a *numericValue*.

TODO: Need to specify the rules for comparing integers and decimal numbers as well as decimal/decimal. As an example, does "5.00" = "5.0"

$$\begin{array}{l}
numericComparison : \\
\quad concreteValue \rightarrow numericComparisonOperator \nrightarrow numericValue
\end{array}$$

4.5 stringComparisonOperator

Attributes whose value is numeric may be compared to an expression constraint using either equals ("=") or not equals ("!="). In the full syntax "¡¿" and "not =" (case insensitive) are also valid ways to represent not equals.

```
stringComparisonOperator = "=" / "!="
```

$$stringComparisonOperator ::= sco\_eq \mid sco\_neq$$

$$
\begin{array}{l}
i\_stringComparisonOperator : \\
\quad Substrate \rightarrow reverseFlag[0\,..\,1] \rightarrow \mathbb{P}\, sctId \rightarrow \\
\quad (stringComparisonOperator \times stringValue) \rightarrow Quads\_or\_Error \\
\hline
\forall\, ss : Substrate;\ rf : reverseFlag[0\,..\,1];\ atts : \mathbb{P}\, sctId; \\
\quad scv : (stringComparisonOperator \times stringValue) \bullet \\
i\_stringComparisonOperator\ ss\ rf\ atts\ scv = \\
\mathbf{if}\ \#rf > 0\ \mathbf{then} \\
\quad quad\_value(\emptyset, targets\_direction) \\
\mathbf{else} \\
\quad quad\_value(\{q : ss.relationships \mid q.a \in atts \wedge q.t \in \operatorname{ran} t\_concrete \wedge \\
stringComparison\,(t\_concrete^{\sim}\,q.t)\,(first\ scv) = (second\ scv)\}, source\_direction)
\end{array}
$$

String comparison function. Compares a *concreteValue* with a *stringValue*.

$$
\begin{array}{l}
stringComparison : \\
\quad concreteValue \rightarrow stringComparisonOperator \nrightarrow stringValue
\end{array}
$$

4.6 focusConcept

A focus concept is a concept reference or wild card, which is optionally preceded by a member of function. A memberOf function should be used only when the conceptReference refers to a reference set concept, or a wild card is used. A wild card represents any concept in the given substrate. In the brief syntax, a wildcard is represented using the "" symbol. In the full syntax, the text "ANY" (case insensitive) is also allowed.*

```
focusConcept = [ memberOf ws] (conceptReference / wildCard)
```

$$
\begin{array}{l}
crOrWildCard ::= cr\langle\!\langle conceptReference\rangle\!\rangle \mid wc \\
focusConcept ::= \\
\quad focusConcept\_m\langle\!\langle crOrWildCard\rangle\!\rangle \mid \\
\quad focusConcept\_c\langle\!\langle crOrWildCard\rangle\!\rangle
\end{array}
$$

Interpretation: If MEMBEROF is present the interpretation of FOCUSCONCEPT is union the interpretation of MEMBEROF applied to each element in the interpretation of CONCEPTREFERENCE . Note that the interpretation of WILDCARD is different in the context of MEMBEROF than it is outside. MEMBEROF WILDCARD is interpreted as the interpretation of the domain of the *refset* function (i.e. all of the refsets in the substrate), where, without, it is interpreted as *all* of the concepts in the system.

If MEMBEROF isn't specified, the interpretation is the substrate interpretations of CONCEPTREFERENCE itself

$$
\begin{array}{l}
\mathit{i\_focusConcept} : \mathit{Substrate} \rightarrow \mathit{focusConcept} \rightarrow \mathit{Sctids\_or\_Error} \\
\hline
\forall\, \mathit{ss} : \mathit{Substrate};\ \mathit{fc} : \mathit{focusConcept} \bullet \\
\mathit{i\_focusConcept}\ \mathit{ss}\ \mathit{fc} = \\
\textbf{if}\ \mathit{focusConcept\_c}^{\sim}\mathit{fc} \in \mathit{crOrWildCard}\ \textbf{then} \\
\quad \textbf{if}\ \mathit{cr}^{\sim}(\mathit{focusConcept\_c}^{\sim}\mathit{fc}) \in \mathit{conceptReference}\ \textbf{then} \\
\quad\quad \mathit{ss.i\_conceptReference}\ (\mathit{cr}^{\sim}(\mathit{focusConcept\_c}^{\sim}\mathit{fc})) \\
\quad \textbf{else} \\
\quad\quad \mathit{ok}\ \mathit{ss.concepts} \\
\textbf{else} \\
\quad \mathit{i\_memberOf}\ \mathit{ss}\ (\mathit{focusConcept\_m}^{\sim}\mathit{fc})
\end{array}
$$

4.6.1 memberOf

MEMBEROF returns the union of the application of the substrate *refset* function to a wild card or the the supplied reference set identifiers. An error is returned if (a) *refsetids* already has an error or (b) the substrate interpretation of a given refsetId returns an error.

$$
\begin{array}{l}
\mathit{i\_memberOf} : \mathit{Substrate} \rightarrow \mathit{crOrWildCard} \rightarrow \mathit{Sctids\_or\_Error} \\
\hline
\forall\, \mathit{ss} : \mathit{Substrate};\ \mathit{crorwc} : \mathit{crOrWildCard} \bullet \\
\quad \mathit{i\_memberOf}\ \mathit{ss}\ \mathit{crorwc} = \\
(\textbf{let}\ \mathit{refsetids} == \\
\quad \textbf{if}\ \mathit{cr}^{\sim}\mathit{crorwc} \in \mathit{conceptReference} \\
\quad \textbf{then} \\
\quad\quad \mathit{ss.i\_conceptReference}(\mathit{cr}^{\sim}\mathit{crorwc}) \\
\quad \textbf{else} \\
\quad\quad \mathit{ok}\ (\mathit{ss.descendants}\ \mathit{refset\_concept}) \bullet \\
\quad \textbf{if}\ \mathit{refsetids} \in \operatorname{ran} \mathit{error} \\
\quad \textbf{then} \\
\quad\quad \mathit{refsetids} \\
\quad \textbf{else} \\
\quad\quad \mathit{bigunion}\{\mathit{sctid} : \mathit{result\_sctids}\ \mathit{refsetids} \bullet \mathit{ss.i\_refsetId}\ \mathit{sctid}\})
\end{array}
$$

5 Types

This section carries various type transformations and error checking functions

5.1 Types

5.1.1 Quads_or_Error

Quads_or_Error is a collection of *Quad*s or an error condition. If it is a collection of *Quad*s, it also carries a direction indicator that determines whether it is the source or targets that carry the matching elements. Note:

- *source_direction* – matches were performed on attribute/target. Return the source *sctId*s.
- *targets_direction* – matches were performed on attribute/source (REVERSEFLAG was present). Return the target *sctId*s or, eventually, concrete values

$$direction ::= source\_direction \mid targets\_direction$$
$$Quads\_or\_Error ::= quad\_value \langle\!\langle \mathbb{P}\, Quad \times direction \rangle\!\rangle \mid gerror \langle\!\langle ERROR \rangle\!\rangle$$

5.1.2 sctIdGroups

A *sctIdGroup* is the combination of an *sctId* and a non-zero *groupId*. The set of all possbile *sctIdGroups* in a given substrate would be the union of all relationship subjects combined with the non-zero relationship groups in which they appear in the substrate relationships.

sctIdGroups_or_Error represents a set of *sctIdGroups* or an error condition

$$sctIdGroup == sctId \times groupId$$
$$sctIdGroups\_or\_Error ::= group\_value \langle\!\langle \mathbb{P}\, sctIdGroup \rangle\!\rangle \mid$$
$$\quad gerror \langle\!\langle ERROR \rangle\!\rangle$$

5.2 Result transformations

- **result_sctids** – the set of *sctId*s in *Sctids_or_Error* or the empty set if there is an error
- **quads_for** – the set of quads in a *Quads_or_Error* or an empty set if there is an error
- **quad_direction** – the direction of a *Quads_or_Error* result. Undefined if error

$$
\begin{array}{|l}
result\_sctids : Sctids\_or\_Error \rightarrow \mathbb{P}\, sctId \\
quads\_for : Quads\_or\_Error \rightarrow \mathbb{P}\, Quad \\
quad\_direction : Quads\_or\_Error \nrightarrow direction \\
\hline
\forall\, r : Sctids\_or\_Error \bullet result\_sctids\ r = \\
\quad \mathbf{if}\ r \in \operatorname{ran} error\ \mathbf{then}\ \emptyset \\
\quad \mathbf{else}\ ok^{\sim}\, r \\
\\
\forall\, q : Quads\_or\_Error \bullet quads\_for\ q = \\
\quad \mathbf{if}\ q \in \operatorname{ran} qerror\ \mathbf{then}\ \emptyset \\
\quad \mathbf{else}\ first\ (quad\_value^{\sim}\, q) \\
\\
\forall\, q : Quads\_or\_Error \bullet quad\_direction\ q = \\
\quad second\ (quad\_value^{\sim}\, q)
\end{array}
$$

Definition of the various functions that are performed on the result type.

- **firstError** – aggregate one or more *Sctids_or_Error* types, at least one of which carries and error and merge them into a single *Sctid_or_Error* instance propagating at least one of the errors (Not fully defined)
- **gfirstError** – convert two *sctIdGroups_or_Error* into a single *sctIdGroups_or_Error* propagating at least one of the errors.

- **union** – return the union of two *Sctids_or_Error* types, propagating errors if they exist, else returning the union of the sctId sets.
- **intersect** –return the intersection of two *Sctids_or_Error* types, propagating errors if they exist, else returning the intersection of the sctId sets.
- **minus** – return the difference of one *Sctids_or_Error* type and a second, propagating errors if they exist, else returning the set of sctId's in the first set that aren't in the second.
- **bigunion** – return the union of a set of *Sctids_or_Error* types, propagating errors if they exist, else returning the union of all of the sctId sets.
- **bigintersect** – return the intersection a set of *Sctids_or_Error* types, propagating errors if they exist, else returning the intersection of all of the sctId sets.

$$
\begin{array}{l}
\mathit{firstError} : \mathbb{P}\, \mathit{Sctids\_or\_Error} \rightarrow \mathit{Sctids\_or\_Error} \\
\mathit{gfirstError} : \mathbb{P}\, \mathit{sctIdGroups\_or\_Error} \rightarrow \mathit{sctIdGroups\_or\_Error} \\[1ex]
\mathit{union}, \mathit{intersect}, \mathit{minus} : \mathit{Sctids\_or\_Error} \rightarrow \mathit{Sctids\_or\_Error} \rightarrow \\
\qquad\qquad \mathit{Sctids\_or\_Error} \\
\mathit{bigunion}, \mathit{bigintersect} : \mathbb{P}\, \mathit{Sctids\_or\_Error} \rightarrow \mathit{Sctids\_or\_Error} \\[1ex]
\mathit{gunion}, \mathit{gintersect}, \mathit{gminus} : \\
\qquad \mathit{sctIdGroups\_or\_Error} \rightarrow \mathit{sctIdGroups\_or\_Error} \rightarrow \mathit{sctIdGroups\_or\_Error}
\end{array}
$$

$$
\begin{array}{l}
\forall\, x, y : \mathit{Sctids\_or\_Error} \bullet \mathit{union}\; x\; y = \\
\qquad \mathbf{if}\ x \in \operatorname{ran} \mathit{error} \lor y \in \operatorname{ran} \mathit{error}\ \mathbf{then}\ \mathit{firstError}\, \{x, y\} \\
\qquad \mathbf{else}\ \mathit{ok}\, ((\mathit{ok}^{\sim} x) \cup (\mathit{ok}^{\sim} y)) \\[1ex]

\qquad \mathbf{if}\ x \in \operatorname{ran} \mathit{gerror} \lor y \in \operatorname{ran} \mathit{gerror}\ \mathbf{then}\ \mathit{gfirstError}\, \{x, y\} \\
\qquad \mathbf{else}\ \mathit{group\_value}((\mathit{group\_value}^{\sim} x) \setminus (\mathit{group\_value}^{\sim} y))
\end{array}
$$

A Optional elements

Representing optional elements of type T. Representing it as a sequence allows us to determine absence by $\# T = 0$ and the value by $head\ T$.

$$T[0\,..\,1] == \{s : \mathrm{seq}\ T \mid \#s \leq 1\}$$

B Generic cardinality evaluation

evalCardinality Evaluate the cardinality of an arbitrary set of type T. If the number of elements in the set of T is greater than *min* and:

- *max* is a number and the number of elements in T is less than *max*
- *max* is *many*

Then return the the set. Otherwise return the empty set.

$$
\begin{array}{l}
[T] \\
\hline
evalCardinality : \mathbb{N} \rightarrow unlimitedNat \rightarrow \mathbb{P}\ T \rightarrow \mathbb{P}\ T \\
\hline
\forall\ min : \mathbb{N};\ max : unlimitedNat;\ t : \mathbb{P}\ T \bullet \\
evalCardinality\ min\ max\ t = \\
\quad \mathbf{if}\ (\#t \geq min) \land (max = many \lor \#t \leq (num^{\sim} max)) \\
\quad \mathbf{then} \\
\quad\quad t \\
\quad \mathbf{else} \\
\quad\quad \emptyset
\end{array}
$$

C Generic sequence function

A generic function that takes:

- A substrate
- A function that takes a substrate, a sequence of type T and returns *Sctids_or_Error* (example: *i_subExpressionConstraint*)
- An operator that takes two *Sctids_or_Error* and returns a combination (example: *union*)
- A tuple of the form "$T \times \mathrm{seq}_1\ T$"

And returns *Sctids_or_Error*

In the formalization below, *first seq_e* refers to the left hand side of the $T \times \mathrm{seq}_1\ T$ and *second seq_e* to the right hand side. *head*(*second seq_e*) refers to the first element in the sequence and *tail*(*second seq_e*) refers to the remaining elements in the sequence, which may be empty ($\langle\rangle$).

$$[T]$$

$$
\begin{aligned}
&applyToSequence : Substrate \rightarrow (Substrate \rightarrow T \rightarrow Sctids\_or\_Error) \rightarrow \\
&\quad (Sctids\_or\_Error \rightarrow Sctids\_or\_Error \rightarrow Sctids\_or\_Error) \rightarrow \\
&\quad (T \times \mathrm{seq}_1\, T) \rightarrow Sctids\_or\_Error
\end{aligned}
$$

$$
\begin{aligned}
&\forall\, ss : Substrate;\ f : (Substrate \rightarrow T \rightarrow Sctids\_or\_Error); \\
&\quad op : (Sctids\_or\_Error \rightarrow Sctids\_or\_Error \rightarrow Sctids\_or\_Error); \\
&\quad seq\_e : (T \times \mathrm{seq}_1\, T) \bullet \\
&applyToSequence\ ss\ f\ op\ seq\_e = \\
&\mathbf{if}\ tail(second\ seq\_e) = \langle\rangle\ \mathbf{then} \\
&\quad op\,(f\ ss\,(first\ seq\_e))(f\ ss\,(head\,(second\ seq\_e))) \\
&\mathbf{else} \\
